Education

Maharshi Dayanand University (MDU)

2023 – 2026

Bachelor of Computer Applications

Rohtak, India

- Relevant Coursework: Data Structures & Algorithms, Object-Oriented Programming, Operating Systems, Database Management Systems, Computer Networks

Technical Skills

Programming Languages: C, C++, Python, JavaScript, SQL

Frontend Technologies: HTML5, CSS3

Backend Technologies: Flask, FastAPI, RESTful APIs

Databases: MySQL, PostgreSQL, Supabase

Data Science & ML: Pandas, NumPy, Seaborn, Matplotlib, Scikit-learn, Data Preprocessing, Feature Engineering

AI Technologies: Large Language Models (LLMs), Generative AI, Prompt Engineering, RAG (Retrieval-Augmented Generation), Sentence-Transformers, Vector Embeddings, Gemini API

Search & Indexing: Elasticsearch, pgvector, Semantic Search

DevOps & Tools: Docker, Git, Render, Netlify

Methodologies: Object-Oriented Programming (OOP), Data Structures & Algorithms

Professional Experience

AI Intern

Jun 2025 – Aug 2025

Appolo Computers Pvt Ltd

New Delhi, India

- Contributed to the development of a resume parsing and analysis system as part of a Smart ATS solution using Python, Elasticsearch, and Large Language Models (LLMs), focusing on extracting structured information from unstructured resumes.
- Built data processing pipelines to transform raw resume text into structured JSON format, improving data quality.
- Collaborated with cross-functional teams to integrate AI-powered features into the ATS platform, enhancing recruiter productivity and candidate matching capabilities.
- Optimized LLM prompts and fine-tuned extraction logic to improve parsing accuracy for diverse resume formats and industry-specific terminology.
- Developed and maintained RESTful APIs using FastAPI and Flask, enabling seamless communication between frontend applications and backend services.

Key Projects

CandidateRadar - RAG-Based ATS System | *FastAPI, Docker, Gemini, Supabase (PostgreSQL + pgvector), Sentence Transformers*

- Built a full RAG pipeline that extracts structured candidate data from resumes (PDF/DOCX) via Gemini, generates embeddings with Sentence-Transformers, and indexes them in Supabase Postgres using pgvector for scalable semantic search.
- Designed a hybrid retrieval system combining SQL-based structured filtering with vector similarity search, then used Gemini to rank candidates and generate per-candidate structured justifications (fit, concerns, experience) as JSON.
- Deployed a production-style full-stack architecture: Dockerized FastAPI backend on Render, static frontend on Netlify, and resume files in Supabase Storage, secured via a serverless proxy function that keeps API credentials off the client.
- Built RESTful FastAPI endpoints for resume ingestion, embedding, and semantic search, exposing a structured JSON response consumed directly by a recruiter-facing candidate search interface.

FinSight AI | *Flask, PostgreSQL, Gemini AI, JavaScript, Tailwind CSS*

- Built a full-stack AI-powered expense tracking web application with a RESTful Flask API backend, JWT-based multi-user authentication and Tailwind CSS frontend.
- Integrated Google Gemini AI to generate personalized financial insights including spending patterns, recommendations and unusual transaction alerts.
- Implemented complete CRUD operations for expense management with category-based filtering, inline editing, monthly budget tracking and real-time data updates.
- Developed interactive spending analytics dashboard featuring Chart.js doughnut charts, monthly spending summaries and recent expense tracking.
- Deployed using Neon PostgreSQL, Render for the Flask backend and Netlify for the frontend with environment-based configuration for production.
